

Sustainable development

Contributed by Administrator

Neavia technologies feel involved in the future of our planet. Neavia has hatched solutions and products with the concern of sustainable development. **VERY LOW POWER CONSUMPTION**

Our systems require 5 to 20 times less power than competitive solutions. They can be power fed by small solar panels.

It leads to savings in cabling. It leads in no buried copper. It leads in a reduction of power consumption reaching some MegaWattHour for a system length of several kilometres. **REUSABLE DEVICES**

Unlike solutions based on devices buried under the road, our products are easy to install and to dismount. They do not require any cabling. When the road is to renew, or when the needs change, our products can be displaced and can be easily reused .

Our efforts have been awarded by the French Ministry of Sustainable Development.
